Hi Bansi,

Hope this email finds you well and healthy. I am reviewing your code of *admin/admin.component.ts* and these are some of my concerns or recommendations.

1. You have used *console.log* to print the results from API services which would lead to data breach, so kindly remove those as, production code should not contain this.
2. In the method *updateProducts()*, I have seen that you call the another method *getProducts()* and then repeat a service calling which is also happening in *getProducts()* method.
3. You have defined a variable of name *baseUrl*, which you are not using, so I suggest you to remove that variable.
4. Code should contain some comments or at least on every methods body which describe its use or purpose.

Please have a look into this and do write back to me if you need any clarity.

Best Regards,
Ahmed Shahid.
